

STEERING DAMPER NON-ADJUSTABLE

Product description

For motorcycle manufacturers: basic steering dampers intended for serial production. Various attachment options to fit the specific model. Damping characteristics individually set to meet the specifications of each series. Integrated oil-filled compensation unit ensures that the damping properties remain constant over a wide range of temperatures.

Technical Data

Size	hub according to manufacturer's specifications
Piston diameter	20 mm
Piston rods	10 mm
Suitable for	Street, ATV

STEERING DAMPER NON-ADJUSTABLE

Overview of success factors

Significant advantages

The WP steering damper has a high stabilising effect on the motorcycle especially when riding at high speed and with varying loads, and the feedback is even better. The maintenance-free construction keeps the damping properties at a constant level. The steering damper is built using high quality components such as CNC milled, anodised aluminium. High-grade bearings, special seals and polished piston rods ensure minimal friction, fine response and high durability of the unit which has been well tried and tested during the 10 years of its serial production.

Top performance

The WP steering damper is a robust and durable product suited to a wide field of usage due to our factory adjustment options.

Better - from WP

Motorcycle manufacturers benefit from the modular structure of the steering damper and from our entire production line - fast construction, a wide range of setting options for the damping properties and, not least, the facilities to produce a large volume in a short time.
